

IDEATION PHASE

Brainstorm & Idea Prioritization Template

Date: 30 September 2026

Team ID: Msu207Team8-6ab24dfd5bdbdc53c88f47

Project Name: Implement Client Script and UI Policy

Maximum Marks: 4 Marks

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Team Gathering and Collaboration

Our team discussed various problems that users may face while working with ServiceNow forms. The discussion focused on improving data accuracy, reducing incorrect data entry, and making form fields respond dynamically to user actions.

The team identified that some fields may need to become mandatory, read-only, visible, or hidden depending on the values entered by the user. The team also identified the need for client-side validation before submitting a form.

After discussing different possible solutions, the team decided to implement **Client Scripts and UI Policies** to improve ServiceNow form behavior.

Problem Statement

How can ServiceNow form usability and data accuracy be improved by dynamically controlling form fields and validating user inputs using Client Scripts and UI Policies?

Problems Identified

1. Users may enter incomplete or invalid information.
2. Some fields need to be mandatory only under specific conditions.
3. Some fields need to be displayed or hidden based on user input.
4. Some fields may need to become read-only based on specific conditions.
5. Manual validation may result in incorrect data entry.
6. Static form behavior may reduce user experience.

Proposed Solution

The proposed solution is to use **Client Scripts** for client-side validation and dynamic processing, and **UI Policies** for controlling field visibility, mandatory status, and read-only behavior based on predefined conditions.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas

No.	Idea	Description
1	Client-side Input Validation	Validate user input before processing or submission.
2	Dynamic Field Visibility	Show or hide fields based on conditions.
3	Mandatory Field Control	Make fields mandatory when required.
4	Read-only Field Control	Prevent modification of selected fields when required.
5	Error Message Display	Display messages when invalid information is entered.
6	Automatic Field Population	Automatically set field values based on user actions.
7	Form Submission Validation	Validate required conditions before submitting the form.
8	Improved User Interface	Make the ServiceNow form more interactive and user-friendly.

Idea Grouping

Group 1 – Validation

- Client-side input validation
- Error message display
- Form submission validation

Group 2 – Dynamic UI Behavior

- Dynamic field visibility
- Mandatory field control
- Read-only field control

Group 3 – Automation

- Automatic field population
- Dynamic changes based on user actions

Group 4 – User Experience

- Improved form interaction
- Clear validation messages
- Reduced unnecessary user input

Step-3: Idea Prioritization

The brainstormed ideas were reviewed based on their relevance to the project. Features directly related to Client Scripts and UI Policies were selected as the primary implementation areas.

No.	Idea	Project Relevance	Priority
1	Client-side Input Validation	Supports Client Script implementation	High
2	Dynamic Field Visibility	Supports UI Policy implementation	High
3	Mandatory Field Control	Supports UI Policy implementation	High

No.	Idea	Project Relevance	Priority
4	Read-only Field Control	Supports UI Policy implementation	High
5	Error Message Display	Supports client-side validation	Medium
6	Automatic Field Population	Additional client-side functionality	Medium
7	Form Submission Validation	Supports Client Script functionality	Medium
8	General UI Improvement	Supports overall project objective	Low

Selected Project Idea

Based on the brainstorming, grouping, and prioritization process, the team selected the following project idea:

“Implement Client Script and UI Policy in ServiceNow to provide client-side validation and dynamically control field visibility, mandatory status, and read-only behavior.”

Expected Outcome

The project will demonstrate how Client Scripts and UI Policies can be used in ServiceNow to create interactive forms, validate user inputs, dynamically control field properties, reduce invalid data entry, and improve the overall form experience.

Conclusion

The ideation process helped the team identify the main problem, generate possible solutions, group related ideas, and define the core features of the proposed project. The selected solution focuses on implementing Client Scripts and UI Policies to achieve dynamic and validated ServiceNow form behavior.
