Project Name: Implement Client Script and UI Policy

Maximum Marks: 2 Marks

Customer Problem Statement

PS-1

I am: A ServiceNow form user.

I'm trying to: Enter the required information correctly and complete the form.

But: I may enter incomplete or invalid information, and some fields may not be clearly identified as required.

Because: The form does not always provide dynamic validation and field behavior based on the information I enter.

Which makes me feel: Confused and uncertain about whether the information entered is correct.

PS-2

I am: A ServiceNow application administrator or developer.

I'm trying to: Provide users with a simple and interactive form experience.

But: Different fields may need to be shown, hidden, made mandatory, or made read-only depending on user selections.

Because: Static form configurations cannot handle all dynamic field requirements.

Which makes me feel: It is difficult to maintain data accuracy and provide an efficient user experience.

Final Problem Statement

ServiceNow users need a form that can dynamically respond to their inputs, validate information, and control field properties such as visibility, mandatory status, and read-only status. Client Scripts and UI Policies can be implemented to address these requirements and improve form usability and data accuracy.
