Project Name: Implement Client Script and UI Policy

Maximum Marks: 2 Marks

Problem

ServiceNow users may face difficulties while entering information in forms because some fields may be incorrectly filled, unnecessary fields may be displayed, and required fields may not always be clearly controlled.

Customer Problems

- Incorrect or incomplete data entry.
- Difficulty identifying mandatory fields.
- Unnecessary fields displayed on the form.
- Fields may need to be read-only under certain conditions.
- Lack of immediate validation feedback.
- Static form behavior can make the form less user-friendly.

Target Customer

ServiceNow Form User

The solution is mainly intended for users who interact with ServiceNow forms and need a simple, clear, and responsive form experience.

Proposed Solution

The proposed solution is to implement **Client Scripts and UI Policies** in ServiceNow.

Client Scripts

Client Scripts will be used to:

- Validate user inputs.
- Display validation messages.
- Perform actions when field values change.
- Validate information before form submission.

UI Policies

UI Policies will be used to:

- Make fields mandatory.
- Show or hide fields.
- Make fields read-only.
- Dynamically change field behavior based on conditions.

Problem–Solution Fit

Customer Problem	Proposed Solution	Expected Result
Incorrect data entry	Client-side validation	More accurate input
Unclear mandatory fields	UI Policy	Required fields are clearly identified
Unnecessary fields displayed	UI Policy	Fields are shown or hidden based on conditions
Fields need to be protected from editing	UI Policy	Fields become read-only when required
Lack of immediate feedback	Client Script	Validation messages are displayed
Static form behavior	Client Script + UI Policy	Dynamic and interactive form

Customer Benefits

- Easier form completion.
- Better data accuracy.
- Clear validation messages.
- Dynamic field behavior.
- Reduced unnecessary data entry.
- Improved user interaction with ServiceNow forms.

Solution Fit Statement

The implementation of Client Scripts and UI Policies addresses the identified ServiceNow form problems by providing client-side validation and dynamic control of field properties. This helps users enter accurate information and interact with the form more efficiently.

Expected Outcome

The final solution will provide a responsive ServiceNow form where fields dynamically change according to predefined conditions and user inputs are validated before submission.
